Text © 2026 Sovereign Quant. Cover design for the Black & Gold Sovereign Edition. Published as a software-licensing manuscript, not as a financial product disclosure.

Publisher: Sovereign Quant Press. Site: www.sovereignquant.com.au

No DRM is applied to this edition. That is a product decision, not a dare to pirate the workstation.

Disclaimer

This book describes software architecture and commercial licensing doctrine. It is not personal financial advice, not a product disclosure statement, and not an offer of a fund, managed account, or brokerage service. Sovereign Quant does not hold client money and does not place trades for the operator. The public workstation does not require a broker account or API keys to exist as a research desk.

Any figures that appear in later volumes or on a playground screen are illustrations of a reporting surface unless a caption names market, window, costs, and the word *simulated*. They are not a track record.

Licence keys are software entitlements. HMAC-SHA256 is the public contract on the live fulfilment terminal as of August 2026. Some repository notes also mention Ed25519. Until those texts converge, treat HMAC as what the issued-key chrome says.

Leveraged markets can produce losses, including total loss of trading capital, if an operator later connects their own execution stack.

Epigraph

A workstation is not sovereign because its maker says so.

It is sovereign only when its architecture makes certain forms of control impossible.

Own the machine that judges the trade. Do not outsource the veto.

Contents

I. The claim on the door	
II. Sovereignty is an engineering problem	
III. Desk, not dealer	
IV. Two machines	
V. What the operator is owed	
VI. What the vendor must not become	
VII. The non-bypassable risk gate	
VIII. The kill switch	
IX. The offline key	
X. The sovereign principle	
Plate A. Architecture	
Plate B. Order of work	
Plate C. Licence tiers	
Walkthrough. A strategy at the gate	
Appendix A. Glossary	
Appendix B. Risk disclosure	
Appendix C. Licence table	
Appendix D. Field manual	
Appendix E. What ships today	
Appendix F. How this edition was made	
Appendix G. Colophon	

I. The claim on the door

The live site states its category in one line: Multi-Agent Quantitative Workstation — v1.3 Core. The hero is three words: SOVEREIGN. QUANT. OFFLINE.

Under that sits the sentence that is the whole commercial object: a strategy-research and risk-control workstation that runs on the operator's machine. It never holds the operator's money, never places trades for the operator, and needs no broker account, no API keys, and no cloud tenancy to exist as a research desk.

That sentence tells a buyer what they are not purchasing. It also tells the builder what they are not allowed to become. Offline software licensing is in bounds. A live multi-tenant dealing room that skims flow is not.

The chrome is deliberate. SYS ACTIVE. HMAC-SHA256 // OFFLINE LICENSING. The login footer says software licensing only, not investment advice. Volume I follows that line and refuses to leave it.

II. Sovereignty is an engineering problem

Sovereignty here is not a mood and not a flag. It is a list of refusals that have to survive contact with a compiler and a checkout form.

The refusals are ordinary when written down. Do not store the operator's market book on a vendor disk as a condition of use. Do not make licence validity a daily network round-trip. Do not let a strategy module construct an order-shaped object that never meets the risk module. Do not take custody so that ease of use can be sold as a feature.

Each refusal has a cost. Offline licences mean the vendor cannot instant-revoke a laptop that never calls home. Non-bypassable risk means the convenient backtest button is slower. Refusing custody means the product cannot be a one-click copy-trader.

If the models live in someone else's region, the desk is only as sovereign as that vendor's terms of service. The commercial website itself is hosted. That is not hypocrisy if the split is clean: the storefront may be rented; the engine that judges the trade may not.

III. Desk, not dealer

A desk researches, sizes, vetoes, and records. A dealer holds money, stands between counterparties, and takes principal or agency risk. Sovereign Quant is allowed to be a desk. It is not allowed, by its own door text, to be a dealer.

The distinction is easy to recite and expensive to keep. Someone will ask for a small live copier. Someone will ask for an Interactive Brokers button on the homepage. Someone will ask the concierge to publish an equity curve without a window or a costs line. The answer is no, and Volume I exists partly so the answer stays no after the first successful checkout.

Paper adapters and sandbox defaults belong in later engineering volumes. They do not belong on the hero of a .com.au software shop. A kill switch that talks to a broker through a vendor server is a different product. Do not advertise that product under this cover.

IV. Two machines

The architecture is two processes that share a brand and meet at a signed key.

The storefront is a React application on sovereignquant.com.au. It sells licences, explains the doctrine, runs checkout, emails a key, and offers a community zip. It may log enough to fulfil an order. That is its job.

The workstation is a local Streamlit process, launched from that zip with run.bat or run.sh, and opened at http://localhost:8501. It is where goals are typed, caches are read, signals are proposed, and gates are applied. Community chrome on a working desk has shown licensee Self-Owned Developer, a fifty-thousand-dollar capital ceiling, and one concurrent strategy.

The only required bridge is the licence key. If a future design adds a live broker adapter, that adapter is the operator’s glass to break, not a homepage control.

Plate A. Two machines. The signed key is the only required bridge.

V. What the operator is owed

The operator who pays, or who downloads Community, is owed a product that matches the door.

They are owed a pack that runs on their machine without a second cloud login to stay valid. They are owed a key whose name and tier appear after activation. They are owed a fulfilment page that does not pretend the world is fine when the browser session is gone — SIGNAL LOST is the adult failure. They are owed a receipt path that recovers the key without a second charge.

They are owed copy that does not baptise a playground Sharpe as a firm track record. They are owed a risk surface that can refuse work, not only print a red number after the fact. They are owed honest file listings: if the manifesto implies a package tree and the zip contains one Streamlit file, say so.

They are not owed custody, fills, yield, or a vendor who will stand in court as their adviser.

VI. What the vendor must not become

The vendor may sell annual entitlements. The vendor may refund and revoke on its own ledger. The vendor may host a storefront. The vendor may answer support mail.

The vendor must not become the machine that judges the trade. The vendor must not hold the book. The vendor must not silently replace HMAC chrome with a phone-home lease and keep the word offline on the hero. The vendor must not let a concierge ship live yield onto the homepage because the clip felt slow.

Internal tools — refund consoles, admin order lists, licence-signing scripts — are loaded firearms. They exist so commerce can be reversed. They do not exist so the vendor can reach into a laptop at the bottom of a drawer.

A later volume may document an owner-only signing tool and a fuller agent package. That destination is not a licence to advertise the destination as the file already in Downloads.

VII. The non-bypassable risk gate

Most platforms print risk after the fact. The public claim is stronger. Risk is a runtime gate. Daily loss, maximum drawdown, portfolio heat, and leverage limits are not suggestions the orchestrator may ignore when a signal looks expensive in the pleasant light of a backtest.

Non-bypassable is a software word. It means there is no blessed import path that constructs an order-shaped object without presenting it to Risk. If a future contributor adds a “just this once” flag, they have changed the product into a different product. This chapter is a reason to reject that pull request.

The four ordinary gates

Daily loss is a clocked budget. Tomorrow is another budget, not a chance to win it back inside the same session by raising size.

Maximum drawdown is a path budget. Recoveries that require doubling down are not recoveries.

Heat is how much of the book is simultaneously alive. Correlation is how heat hides.

Leverage is a multiplier cap that does not care how pretty a residual looks.

Plate B. Goal → data → strategy → risk → report or veto. There is no side door.

What the gate is allowed to compute

Volume I does not publish a secret alpha. It publishes the shape of the veto. The following are definitions the desk may enforce. They are not a promise that every Community build prints them in this notation.

Daily loss. Let E_0 be session-start equity and E_t mark-to-model equity. Refuse new risk when $(E_t - E_0) / E_0 \leq -L_{\text{day}}$.

Drawdown. Let H_t be the running peak of E . Refuse when $(E_t - H_t) / H_t \leq -L_{\text{dd}}$.

Heat. Let w_i be live gross weight. Refuse when $\sum |w_i| > H_{\text{max}}$, or when a correlation-adjusted sum exceeds the same cap. Heat without correlation is a lie the book tells itself.

Leverage. Refuse when gross notional / equity $> \lambda_{\text{max}}$.

A Community sidebar that shows a modest capital ceiling and “concurrent strategies: up to 1” is the gate made visible. Visibility is not the gate. The gate is the veto.

VIII. The kill switch

A stop-loss lives on a position. A kill switch lives on the desk. When it is thrown, new risk is refused. On the public product that may mean “generate no further research actions,” because the public product does not hold broker keys.

People who sell kill switches on hosted robots are selling a button that talks to a server that talks to a broker. Sovereign Quant’s switch, if it is faithful to the homepage, is local. It cannot save an operator who later bolts on their own adapter and disables the breaker to see what happens.

Sandbox forced by default is the correct default for any future execution adapter. Live keys should feel like breaking glass, not like a configuration toggle. Interactive Brokers MCP does not belong on the commercial site.

IX. The offline key

The fulfilment terminal labels the key HMAC-SHA256 // OFFLINE KEY. The licensee name is a payload, not etiquette. Duration on a Professional example is 365 days. Max capital on that tier is a software ceiling, not a brokerage margin line.

You buy on the site. You receive a key on the fulfilment page and, in the intended design, by email. You paste it under Activate New Licence Key. Verification uses vendor material at issue time and the public verification logic shipped in the app thereafter. The licensing server is not required to see the machine again for the key to keep working until expiry.

The trade-off is old. A determined operator can abuse a key on several machines. A vendor who never hears from the app cannot push an instant remote revoke to a dark laptop. The refund console exists for the commercial half of that problem.

Some notes and a zip README still say Ed25519. The issued-key chrome says HMAC-SHA256. Until the texts converge, HMAC is the public contract. A book that mixes them trains customers to paste the wrong object into the sidebar.

Community	Professional	Institutional
\$0	\$499 / yr	\$1,999 / yr
\$50k cap	\$1m cap	\$50m cap
1 strategy	3 strategies	10 strategies

Plate C. Published tiers. Community is a real pack, not an empty trial shell.

X. The sovereign principle

Own the machine that judges the trade. Do not outsource the veto. Do not custody what you do not want to be responsible for. Do not print a backtest as a personality.

The principle is smaller than a vision deck and larger than a feature list. It will still apply if the agents are rewritten, if HMAC is replaced by a better signature, if the only market left on the playground is one unromantic contract.

Sovereign Quant, at the domain that actually loads, is an attempt to make that principle purchasable as software without turning it into a fund. Volume I is an attempt to write the principle down before the mythology hardens around the wrong object.

Your machine. Your models. Your edge. Your veto.

Walkthrough. A strategy at the gate

This walkthrough is illustrative. It is not a live ticket and not a promise that every Community build prints these exact lines.

Pass

An operator on Community types a goal: backtest a paired spread on BTC/USDT and ETH/USDT against a local parquet cache, default risk limits. Data reports two series present. Strategy proposes a small residual trade inside the one-strategy cap and inside the fifty-thousand-dollar ceiling. Risk finds daily loss unused, drawdown inside bound, heat equal to one book, leverage under cap. The action is admitted to the report tab. A correlation id is written. Nothing is sent to a broker.

Fail

The same operator raises size until notional would breach the Community ceiling, or adds a second concurrent specification. Risk refuses. The orchestrator does not get a private door. The report, if any, records a veto rather than a fill. That refusal is the product.

If a screen recording cannot show the refusal, do not write voice-over that claims the gate blocked an oversized order. Show the sidebar limits instead. Doctrine that cannot be demonstrated should not be shouted.

Appendix A. Glossary

Community pack. The free zip from GET /api/download/community.

Fulfilment terminal. The post-checkout page that displays an issued HMAC key.

HMAC-SHA256. The keyed-hash construction on the live licence chrome.

Kill switch. Desk-level halt, distinct from a per-position stop.

Licensee name. The string signed into the key and shown after activation.

Non-bypassable gate. A risk check every path must encounter.

Orchestrator. The supervisor that routes work among agents.

SIGNAL LOST. Fulfilment state when the browser session cannot be confirmed.

Workstation. Local Streamlit process on port 8501 in the public pack.

Appendix B. Risk disclosure

Trading foreign exchange, commodities, indices, crypto-assets, and other leveraged markets carries a high level of risk and may not be suitable for every operator. Leverage can work against the operator as well as for them. Past simulated results do not indicate future results.

Sovereign Quant is a technology vendor. It is not a financial adviser, broker, or investment manager. No company suffix beyond the trading name on the domain is asserted in this edition. If a Pty Ltd or other entity is later registered, put that name in a reprint.

Appendix C. Licence table

Tier	Price	Capital cap	Strategies
Community	\$0	\$50,000	1
Professional	\$499 / year	\$1,000,000	3
Institutional	\$1,999 / year	\$50,000,000	10

Prices and caps as published on the live desk in August 2026. Confirm on the pricing section before a reprint.

Appendix D. Field manual

Download the community pack from the site or GET /api/download/community. On Windows, run.bat. On Mac or Linux, chmod +x run.sh and ./run.sh. Open <http://localhost:8501>. Stay on Community or paste a paid key under Activate New Licence Key. Run research inside the gates. If fulfilment dies, use the receipt and /portal, not a second payment.

Replace generic site narration with a recording of that sequence when you have one. Do not put live yield on the thumbnail.

Appendix E. What ships today

What a stranger can verify: a marketing site with TLS; login; checkout field validation; a community zip; a Streamlit app with licence chrome and risk language; HMAC issuance; an operator refund ledger.

What brochures still imply beyond that zip: a package tree under `src/sovereign_quant/agents/`, typed messages, an owner-only signing tool, a CCXT adapter with sandbox default. Sales copy should say community workstation for the zip and v1.3 architecture for the destination.

Appendix F. How this edition was made

Volume I was typeset to match the Black & Gold cover prepared for Google Play Books listing GGKEY:5NJEUNWZZHJ. It compresses the sovereignty doctrine into ten chapters, three plates, one illustrative walkthrough, and seven appendices. It is not a rewrite of playground numbers as glory.

Later volumes, if any, may cover strategy families, reporting, and field engineering. They should not quietly turn this book into a dealer manual.

Appendix G. Colophon

Set in Times for the interior. Cover supplied as a 1600 × 2400 RGB JPEG. Interior trim 6 × 9 in. Fixed-layout PDF for Google Play Books. No password. No DRM.
